<b>Office Action Summary</b>	<b>Application No.</b> 10/597,496	<b>Applicant(s)</b> MAEKAWA ET AL.	
	<b>Examiner</b> GREG BENZON	<b>Art Unit</b> 2444	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

#### Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

#### Status

- 1) ☒ Responsive to communication(s) filed on 07 June 2010.
- 2a) ☒ This action is **FINAL**.                      2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

#### Disposition of Claims

- 4) ☒ Claim(s) 4,5,8-16,20,21,24-28,32,36,37 and 54-58 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 4,5,8-16,20,21,24-28,32,36,37 and 54-58 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

#### Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

#### Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All    b) ☐ Some \*    c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

### **DETAILED ACTION**

This application has been examined. Claims 4-5, 8-16, 20-21, 24-28, 32, 36-37 , 54-58 are pending. Claims 1-3, 6-7, 17-19, 22-23, 29-31, 33-35, 38-53 are cancelled.

### ***Making Final***

Applicant's arguments filed 06/07/2010 have been fully considered but they are not persuasive.

The Examiner is maintaining the rejection(s) using the same grounds for rejection and thus making this action FINAL.

### ***Priority***

This application claims benefits of priority from Foreign Application 2004-022902 filed January 30, 2004. (JAPAN)

The effective date of the claims described in this application is January 30, 2004.

### ***Response to Arguments***

Applicant's arguments filed 06/07/2010 have been fully considered but they are not persuasive.

The Applicant presents the following argument(s) [*in italics*]:

*... the combination of Verma and Knowledge... do not serve to identify the communication destination device, much less identify the communication destination device before tunnel communications begin as claimed.*

The Examiner respectfully disagrees with the Applicant.

Verma Column 6 Lines 10-35, Column 9 Lines 35-45 distinguishes between caller (tunnel initiator) and callee (tunnel endpoint). Further Verma disclosed a table for storing relationships between endpoints and their addresses.

Verma disclosed distinguishing between caller (tunnel initiator) and callee (tunnel endpoint) before the tunnel communications begin.

The Applicant presents the following argument(s) [*in italics*]:

*... According to claim 4, the address of the information- processing device changes depending on whether the information-processing device is the caller or the callee, and for each tunnel communication...Verma also fails to teach an address determination part of an information-processing device performs such a change as claimed...*

The Examiner respectfully disagrees with the Applicant.

The Examiner notes that for each current and distinct tunneling session an endpoint terminal cannot change status between (tunnel initiator) and callee (tunnel endpoint). Thus the claimed '*changes depending on whether the information-*

Art Unit: 2444

*processing device is the caller or the callee'* can only occur at during setup phase.

There can only be one endpoint tunneling address assigned for each endpoint caller (tunnel initiator) and callee (tunnel endpoint) for the duration of the tunnel.

Since Verma disclosed distinguishing between caller (tunnel initiator) and callee (tunnel endpoint) before the tunnel communications begin, and furthermore assigning their respective endpoint tunneling addresses then Verma disclosed '*changes depending on whether the information-processing device is the caller or the callee'*.

The Applicant presents the following argument(s) [*in italics*]:

*...Verma discloses that the initiator transmits an address to which the end point can respond, but the address appears to be the same address that the terminal identified as the "initiator" would transmit in response to receiving a connection request.*

The Examiner respectfully disagrees with the Applicant.

The only possibility for an endpoint to change status and change tunneling address is upon establishment of a new tunnel. The establishment of the new tunnel as disclosed by Verma necessitates dynamic re-assignment of the tunneling address depending on the caller (tunnel initiator) and callee (tunnel endpoint). While Verma does not explicitly and inherently exclude the possibility of reusing a tunneling address, it would have been obvious to a person of ordinary skill in the networking art that the objective of Verma is to differentiate each distinct tunneling session by assigning different tunneling address depending on the caller (tunnel initiator) and callee (tunnel

Art Unit: 2444

endpoint). Thus the Examiner does not believe that in Verma *the address appears to be the same address that the terminal identified as the "initiator" would transmit in response to receiving a connection request.*

The Applicant presents the following argument(s) [*in italics*]:

... *On the contrary, our invention targets a system with network layer 3 (Network), with path determination and logical addressing (IP address)...*

The Examiner respectfully disagrees with the Applicant.

The Examiner notes that Verma Column 9 Lines 25-30 disclosed a mapping process including *path determination and logical addressing (IP address).*

The Applicant presents the following argument(s) [*in italics*]:

...*the addresses in Verma can be retrieved via conventional methods such as by placing a DNS call. Such addresses are independent of the status of a calling information-processing device as a caller or callee.*

The Examiner respectfully disagrees with the Applicant.

While Verma disclosed conventional methods the disclosure by Verma is not limited to said conventional methods.

The Applicant presents the following argument(s) [*in italics*]:

*... Servers such as the DNS server disclosed in Verma can store fixed IP-address relationships, and thus do not assign a different address to different information-processing devices during a different tunnel communication depending on whether that information-processing device is the callee or caller.*

The Examiner respectfully disagrees with the Applicant.

Verma Column 10 Lines 30 disclosed an embodiment does not require static table entries. Verma thus disclosed *assigning a different address to different information-processing devices during a different tunnel communication depending on whether that information-processing device is the callee or caller.*

### ***Claim Rejections - 35 USC § 103***

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 4, 8-9, 16, 20, 24-25, 27-28, 54 rejected under 35 U.S.C. 103(a) as being unpatentable over Verma (US Patent 6614809 ) in view of what was well-known in the networking art.

Verma disclosed wherein a tunnel media translator receives, stores, and maps both source device tunnel information and destination device tunnel information to each other in order to effect the tunnel communication. The translator maps an IP address

Art Unit: 2444

and UDP port of an IP link to a virtual path identifier (VPI) and virtual channel identifier (VCI) for an ATM network. The ATM network address may be determined dynamically for each source and destination device. In order to obtain a network address on the ATM network, tunnel media translator 440 will send a host name resolution (HNR) call, which operates in a manner similar to a DNS call, that contains the host name value. In response to the HNR call, the host name server 474 returns a HNR reply that contains a network address that corresponds to the host name or system identifier in the HNR call.

Verma disclosed (re. Claim 4 ) an information-processing device for a communication source that performs tunnel communication with a communication destination device, comprising:

a tunnel communication part including a network interface for communicating with a server via a communication line of a communication network, wherein the tunnel communication part acquires an identifier and an IP address of a communication destination device from the server (Verma-Column 7 Lines 35-45, destination tunnel endpoint 150 *inserts its own address and tunnel identifier into the SCCRP connection reply message* ) and then performs the tunnel communication over the communication network with encapsulated communication target data;(Verma-Column 4 Lines 15-45)

a judgment part for determining whether the information-processing device is to be the source of the tunnel communication or a destination of the tunnel communication in each of the tunnel communications; (Verma-Column 8 Lines 30-45)

Art Unit: 2444

and

an address determination part including a computer-readable memory storing a relationship that returns a caller address (Verma-‘ the host name server 474 returns a HNR reply that contains a network address that corresponds to the host name or system identifier in the HNR call ‘) between a caller address to be included in the encapsulated communication target data when the information-processing device is identified as the source by the judgment part and a callee address to be included in the encapsulated communication target data when the information-processing device is identified as the destination by the judgment part , wherein the caller address is different from the called address, wherein the address determination part selects the caller address for the information-processing device when the information-processing device is the source and the callee address for the information-processing device when the information-processing device is the destination to be included in the communication target data according to the relationship based at least in part on the determination by the judgment part. (Verma-figure 7a,Column 4 Lines 35-55, Column 6 Lines 15-35)

While Verma does not explicitly disclose distinguishing between a caller or callee it would have been obvious to a person of ordinary skill in the networking art that a remote client that originates the tunnel request is a caller, and the responding entity on the second network is a callee and that Verma is able to distinguish between the caller and callee.

Verma Column 6 Lines 10-35, Column 9 Lines 35-45 distinguishes between caller (tunnel initiator) and callee (tunnel endpoint). Further Verma disclosed a table for storing relationships between endpoints and their network addresses. Verma uses the network address returned by the host name server in translating the tunnel packets without de-tunneling or re-tunneling the packets.

Claims 16, 28 (re. system) is rejected on the same basis as Claim 4.

Claims 20 (re. server) is rejected on the same basis as Claim 4.

The motivation to combine described in Claim 4 applies to Claims 16,28,and 20.

Verma disclosed (re. Claim 8,24 ) a tunnel communication identifier acceptor for accepting a tunnel communication identifier for identifying the tunnel communication; wherein the address determination part determines an address used for the communication target data, according to the determination by the judgment part and the tunnel communication identifier. (Verma-Column 7 Lines 35-55)

The motivation to combine described in Claim 4 applies to Claims 8,24.

Verma disclosed (re. Claim 9,25 ) wherein the address determination part determines a part of the address used for the communication target data according to

Art Unit: 2444

the tunnel communication identifier, and determines another part of the address used for the communication target data according to the determination by the judgment part.

(Verma-Column 6 Lines 35 thru Column 7 Lines 55)

The motivation to combine described in Claim 4 applies to Claims 9,25.

Verma disclosed (re. Claim 27 ) wherein the address output part transmits the first address and the second address to the first information-processing device and the second information-processing device. (Verma-Column 6 Lines 35 thru Column 7 Lines 55)

The motivation to combine described in Claim 4 applies to Claims 27.

Verma disclosed (re. Claim 54 ) wherein the relationship includes a function that determines at least one of the caller address and the callee address as a function of a variable established by the signal from the judgment part. (Verma-Column 9 Lines 60 thru Column 10 Lines 5, 'host name resolution call')

***Claim Rejections - 35 USC § 103***

Art Unit: 2444

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 5,10,21,26 rejected under 35 U.S.C. 103(a) as being unpatentable over Verma (US Patent 6614809 ) in view of Hopprich (US Patent 6792474).

While Verma disclosed an address determination part for providing caller and callee address, Verma did not disclose a plurality of predetermined addresses available to be selected for caller and callee.

While Verma substantially disclosed the claimed invention Verma did not disclose (re. Claim 5,21 ) wherein the address determination part determines the address used for the communication target data by selecting from a plurality of predetermined addresses available to be selected as the caller address and a plurality of additional predetermined addresses available to be selected by the address determination part as the callee address, and the address determination part determines at least one of the caller address and the callee address from among the plurality of the predetermined addresses and the plurality of additional predetermined addresses to be included in the communication target data.

Hopprich Column 13 Lines 35-40 disclosed wherein an address server can maintain each set of guest addresses (two or more sets) and can assign a particular

Art Unit: 2444

address for a requesting computer system from one of the sets based on the verified identity of the requesting computer system. In Hopprich the requesting computer systems are equivalent to the caller and callee devices because the said computer systems are establishing a data communications session. The address assignment information allows the data communications devices to create special "tunnel" routes or network paths between the devices.

Hopprich disclosed (re. Claim 5,21 ) wherein the address determination part determines the address used for the communication target data by selecting from a plurality of predetermined addresses (Hopprich-*'a set of guest addresses'*) available to be selected as the caller address and a plurality of additional predetermined addresses available to be selected by the address determination part as the callee address, and the address determination part determines at least one of the caller address and the callee address from among the plurality of the predetermined addresses and the plurality of additional predetermined addresses to be included in the communication target data. (Hopprich- Column 13 Lines 35-40 , *address server can maintain each set of guest addresses (two or more sets) and can assign a particular address for a requesting computer system from one of the sets based on the verified identity of the requesting computer system. In Hopprich the requesting computer systems are equivalent to the caller and callee devices because the said computer systems are establishing a communications session. The address assignment information allows the data communications devices to create special "tunnel" routes or network paths between the devices. )*

Verma and Hopprich are analogous art because they present concepts and practices regarding establishment of tunnel communications. At the time of the invention it would have been obvious to combine Hopprich into Verma. The motivation for said combination would have been to enable the DHCP server to inform the other DHCP servers (if others exist) that the selected address is now in use on the network by a specific computer system and that this address should not be subsequently selected for assignment to another computer system until it is released by the computer system.

The motivation to combine described in Claim 4 applies to Claims 5,21.

Verma-Hopprich disclosed (re. Claim 10,26 ) wherein the address determination part determines at least a part of the address used for the communication target data (Verma-Column 6 Lines 35 thru Column 7 Lines 55) by selecting from a plurality of predetermined addresses. (Hopprich- Column 13 Lines 35-40 , *address server can maintain each set of guest addresses (two or more sets) and can assign a particular address for a requesting computer system from one of the sets based on the verified identity of the requesting computer system. In Hopprich the requesting computer systems are equivalent to the caller and callee devices because the said computer systems are establishing a communications session. The address assignment information allows the data communications devices to create special "tunnel" routes or network paths between the devices. )*

The motivation to combine described in Claim 5 applies to Claims 10,26.

***Claim Rejections - 35 USC § 103***

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 11-15,32,36,37,55-58 rejected under 35 U.S.C. 103(a) as being unpatentable over Verma (US Patent 6614809 ) in view of Keane (US Patent 7395354).

Verma disclosed wherein a tunnel media translator receives, stores, and maps both source device tunnel information and destination device tunnel information to each other in order to effect the tunnel communication. The translator maps an IP address and UDP port of an IP link to a virtual path identifier (VPI) and virtual channel identifier (VCI) for an ATM network. The ATM network address may be determined dynamically for each source and destination device. In order to obtain a network address on the ATM network, tunnel media translator 440 will send a host name resolution (HNR) call, which operates in a manner similar to a DNS call, that contains the host name value. In response to the HNR call, the host name server 474 returns a HNR reply that contains a network address that corresponds to the host name or system identifier in the HNR call.

Verma (re. Claim 32 ) substantially disclosed the claimed invention as described in the rejection for Claim 1.

Furthermore Verma disclosed (re. Claim 32) *a plurality of different tunnel communication*, (Verma-Table 2) and defining a relationship for each tunnel communication.

Verma disclosed a maintaining a table of relationships for at least one tunnel communications. The Examiner notes that while Verma does not explicitly indicate maintaining a plurality different tunnel communications, it would have been obvious to a person of ordinary skill in the networking art that the Verma tunnel media translator, using the said table, is enabled to store and maintain a plurality of different tunnel communication relationships.

While Verma substantially disclosed the claimed invention Verma did not disclose (re. Claim 32) *wherein at least one of the caller address and the callee address is to be used for different information-processing devices involved in a plurality of tunnel communications*.

The Examiner interprets the above limitation in Claim 32 to indicate that caller and callee devices as distinct devices but using the same address.

While Verma substantially disclosed the claimed invention Verma did not disclose (re. Claim 11 ) a detection part for detecting whether two or more addresses

Art Unit: 2444

used for the communication target data are the same in the two or more tunnel communications; and an address changing part for changing at least one of the addresses used for the communication target data if the detection part detects that two or more addresses are the same.

Keane disclosed (re. Claim 32) wherein at least one of the caller address and the callee address is to be used for different information-processing devices involved in a plurality of tunnel communications. (Keane-Column 8 Lines 25 thru Column 9 Lines 25)

Keane disclosed (re. Claim 11 ) a detection part for detecting whether two or more addresses used for the communication target data are the same in the two or more tunnel communications; (Keane-Column 8 Lines 25 thru Column 9 Lines 25) and an address changing part for changing at least one of the addresses used for the communication target data if the detection part detects that two or more addresses are the same. (Keane-Column 8 Lines 25 thru Column 9 Lines 25)

Verma and Keane are analogous art because they present concepts and practices regarding establishment of tunnels and tunnel identifiers. At the time of the invention it would have been obvious to combine Keane into Verma. The motivation for said combination would have been to enable a less cumbersome approach for resolving address conflicts in networks. (Keane-Column 2 Lines 15-25)

Verma-Keane disclosed (re. Claim 12) an address change information receiver for receiving address change information including information related to an address

Art Unit: 2444

change; (Keane-Column 8 Lines 25 thru Column 9 Lines 25) and an address changing part for changing the address used for the communication target data, according to the address change information. (Keane-Column 8 Lines 25 thru Column 9 Lines 25)

The motivation to combine described in Claim 11 applies to Claims 12.

Verma-Keane disclosed (re. Claim 13 ) a detection part for detecting whether two or more addresses that are used for the communication target data are the same in the two or more tunnel communications; (Keane-Column 8 Lines 25 thru Column 9 Lines 25)

an address agreement information transmitter for transmitting address agreement information showing that addresses are the same if the detection part detects that two or more addresses are the same; (Keane-Column 8 Lines 25 thru Column 9 Lines 25)

an address change information receiver for receiving address change information including information related to address change; (Keane-Column 8 Lines 25 thru Column 9 Lines 25) and

an address changing part for changing the address used for the communication target data according to the address change information. (Keane-Column 8 Lines 25 thru Column 9 Lines 25)

The motivation to combine described in Claim 11 applies to Claims 13.

Verma-Keane disclosed (re. Claim Claim 14 ) an address output part for outputting the address determined by the address determination part. (Keane-Column 8 Lines 25 thru Column 9 Lines 25)

The motivation to combine described in Claim 11 applies to Claims 14.

Verma-Keane disclosed (re. Claim 15) wherein the address output part transmits the address determined by the address determination part. (Keane-Column 8 Lines 25 thru Column 9 Lines 25)

The motivation to combine described in Claim 11 applies to Claims 15.

Verma-Keane disclosed (re. Claim 36,37) a tunnel communication identifier acceptor for accepting a tunnel communication identifier for identifying the tunnel communication; wherein the address determination part determines an address used for the communication target data, according to the determination by the judgment part and the tunnel communication identifier. (Verma-Column 7 Lines 35-55)

The motivation to combine described in Claim 32 applies to Claims 36,37.

Verma-Keane disclosed (re. Claim 55 ) wherein the relationship comprises a lookup table including at least one caller address corresponding to the caller and at

Art Unit: 2444

least one

callee address corresponding to the callee. (Verma-Column 9 Lines 60 thru Column 10 Lines 5, *'host name resolution call'*)

Verma-Keane disclosed (re. Claim 56) wherein the lookup table comprises a plurality of different caller addresses available to be selected for the caller and a plurality of different callee addresses available to be selected for the callee. (Verma-Column 9 Lines 60 thru Column 10 Lines 5, *'host name resolution call'*)

Verma-Keane disclosed (re. Claim 57) wherein the relationship comprises a function including a variable (Verma-*'host name value'*) that is given a value in response to said determining which of the first information-processing device and the second information- processing device performing tunnel communication is the caller and which is the callee, and wherein the function returns the caller address (Verma-*'a reply containing the network address'*) or the callee address based on the value of the variable. (Verma-Column 9 Lines 60 thru Column 10 Lines 5, *'host name resolution call'*)

Verma-Keane disclosed (re. Claim 58) a comparison of a least significant digit of a communication destination device identifier to a least significant digit of a communication source device identifier. (Keane-Column 8 Lines 55-65, *the process of determining conflicting addresses involves comparing the device addresses, said*

Art Unit: 2444

*comparison inherently involving all the digits of the address information including the least significant bit)*

The motivation to combine described in Claim 32 applies to Claims 54-58.

### **Conclusion**

**Examiner's Note:** Examiner has cited particular columns and line numbers in the references applied to the claims above for the convenience of the applicant. Although the specified citations are representative of the teachings of the art and are applied to specific limitations within the individual claim, other passages and figures may apply as well. It is respectfully requested from the applicant in preparing responses, to fully consider the references in entirety as potentially teaching all or part of the claimed invention, as well as the context of the passage as taught by the prior art or disclosed by the Examiner.

In the case of amending the claimed invention, Applicant is respectfully requested to indicate the portion(s) of the specification which dictate(s) the structure relied on for proper interpretation and also to verify and ascertain the metes and bounds of the claimed invention.

**THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

Art Unit: 2444

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to GREG BENGZON whose telephone number is (571)272-3944. The examiner can normally be reached on Mon. thru Fri. 8 AM - 4:30 PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, William Vaughn can be reached on (571)272-3922. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Art Unit: 2444
